How to read

Each panel shows one model family's persona signature as a polygon over the seven axes.

- Values are z-scored across models — 0 (dotted ring) is the cross-model average; outward = above average, inward = below.
- A faint grey polygon shows the global cross-model mean for reference.

Compare panels to see how each family leans differently. Look for axes where one family extends far out (signature trait) while others sit near the baseline.
