How to read

Each panel shows one persona axis. Dots mark each model's mean projection over all evaluation prompts; the line connects to zero (the cross-prompt midpoint).

- Horizontal bars are 95% bootstrap confidence intervals (resampled over prompts).
- Models are grouped by family (color); families separated by a thin gap.

Look for: (a) which models are consistently far from zero on an axis, (b) whether models within a family cluster together, (c) axes where CIs overlap heavily — those don't discriminate models.
